[Can Potential NSA Spyware Be Detected And Or Removed](#)

Filters are implemented either as an *ignore* filter or as a *delete* filter. The ignore filters keep the alarms in the database but they are not forwarded to the next agent. But they are saved for forensic investigation. The delete filters removes alarms permanently from the database. All static filters have a limited duty cycle defined by the operator and have to be reactivated afterwards.

3.2 Adaptive filtering

Static filter deals with known problems. However, since it is not possible to foresee all future misconfigurations, adaptive filtering algorithms were implemented to suggest new filter rules to the administrator. This is based on Naïve Bayesian (NB) learning [Hec96]. The idea is to train a NB text classifier to classify messages by looking at word statistics of messages. The NB-classifier has to be trained first with a subset of messages labelled as interesting or not. During training, a knowledge base is automatically acquired, enabling the NB-classifier to assess whether unknown messages are interesting.

The adaptive filters are used in the following workflow:

1. For performance reasons, the algorithm for adaptive filtering is launched on a periodic basis.
2. The algorithm suggests filter rules for top scoring events to a human expert via HMI.
3. The reply is also used to optimise the training corpus, achieving on-line retraining.
4. In order to avoid over learning effects, features, hardly ever occurring in time, are reduced in their significance and are finally forgotten.

3.3 Aggregation

Repeated, identical alarms do not provide any additional information. It would reduce the information overload if each all these alarms were represented in only one alarm including the number of its frequency. The relevant fields for aggregation have to be defined for each source individually. For Snort the source and destination IP, as well the server ports and the messages are relevant. Ephemeral ports can be ignored. For Syslog, the PID number is unimportant but the program and the message field is relevant. All data is aggregated within a given time window.

3.4 Correlation

Motivation to build an automatic correlation agent is the fact that human operators successfully correlate information from different INFOSEC mechanisms in search for known attacks. Moreover, humans are capable to find indications for attacks even though they are not known. However, the way a security expert analyses the information is
